Experiment 15
Creating and Managing Virtual Machine Snapshots

Aim

To create and manage snapshots of a virtual machine using VMware Workstation and view the snapshot history through Snapshot Manager.

Algorithm

1. Open VMware Workstation and select the required virtual machine from the Library.
2. Power on the virtual machine if a snapshot of its running state is required.
3. Open the Snapshot menu and select Take Snapshot.
4. Enter a suitable name and description for the snapshot.
5. Confirm the operation and wait for VMware Workstation to create the snapshot.
6. Repeat the snapshot process to create another snapshot when required.
7. Open Snapshot Manager to view the available snapshots and the current position in the snapshot tree.
8. Select a snapshot to view its details or use the available options to manage it.
9. Close Snapshot Manager after verifying the snapshot history.

Implementation

Input

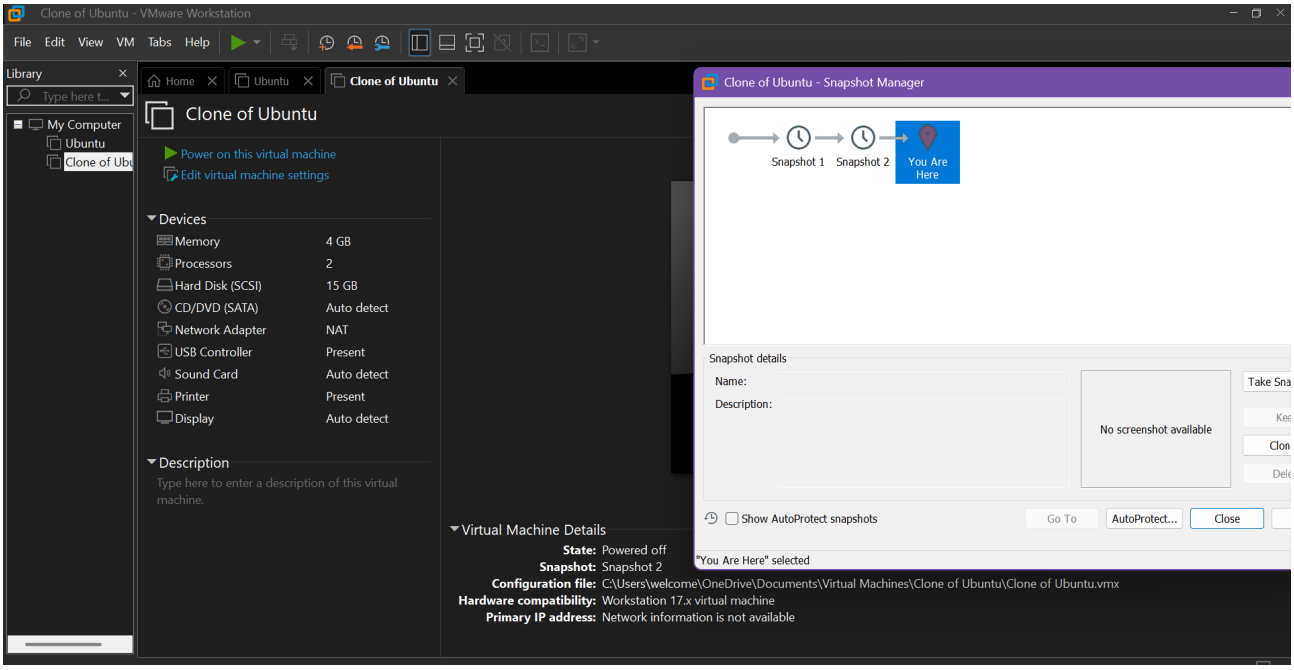

Figure 1: Snapshot Manager showing Snapshot 1, Snapshot 2 and the current state of Clone of Ubuntu.

Output

The Snapshot Manager for the virtual machine named **Clone of Ubuntu** displays two snapshots, Snapshot 1 and Snapshot 2. The current position, **You Are Here**, is selected after Snapshot 2.

Virtual machine: Clone of Ubuntu

Snapshots displayed: Snapshot 1 and Snapshot 2

Current position: You Are Here

Snapshot shown in VM details: Snapshot 2

Virtual machine state: Powered off

The screenshot confirms that the snapshot history is available in Snapshot Manager. The current state is shown after Snapshot 2. The VM is powered off at the time of capture.

Result

Thus, snapshots of the Clone of Ubuntu virtual machine were created and viewed successfully using VMware Workstation Snapshot Manager.
